D-Type Level-Triggered Latch

Slightly Modified

Operations

- Circuit latches on one bit of memory and keeps it around
- Truth table

Data-In	Write	Data-Out
0	1	0
1	1	1
X	0	Data

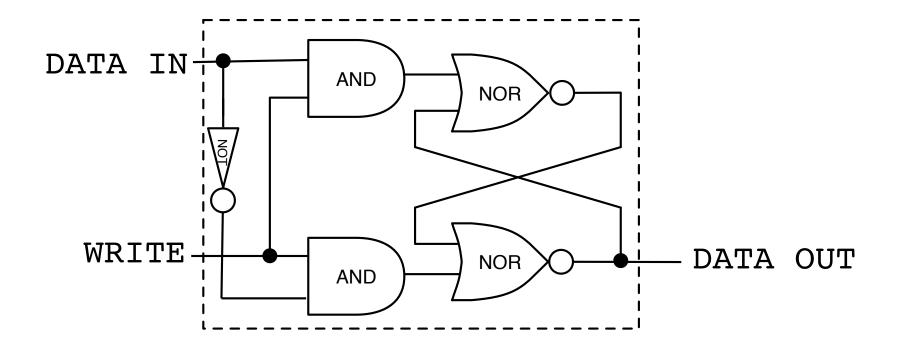

• Can write 1 bit and read content

multi-bit storage

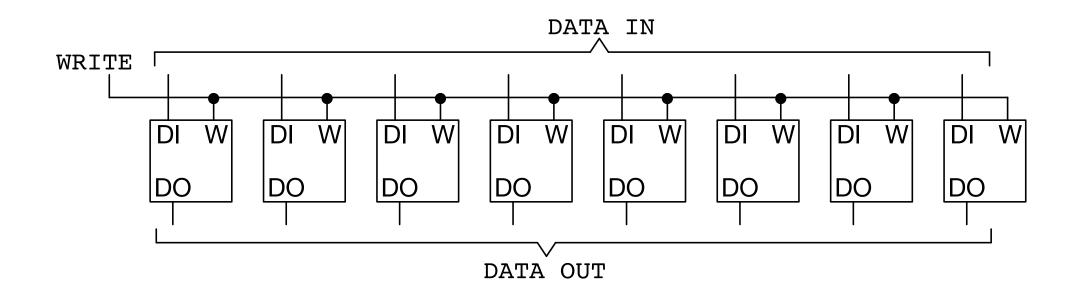

1 Bit Memory

8 Bit Memory

• 8 Bit Latch contains 8 bits

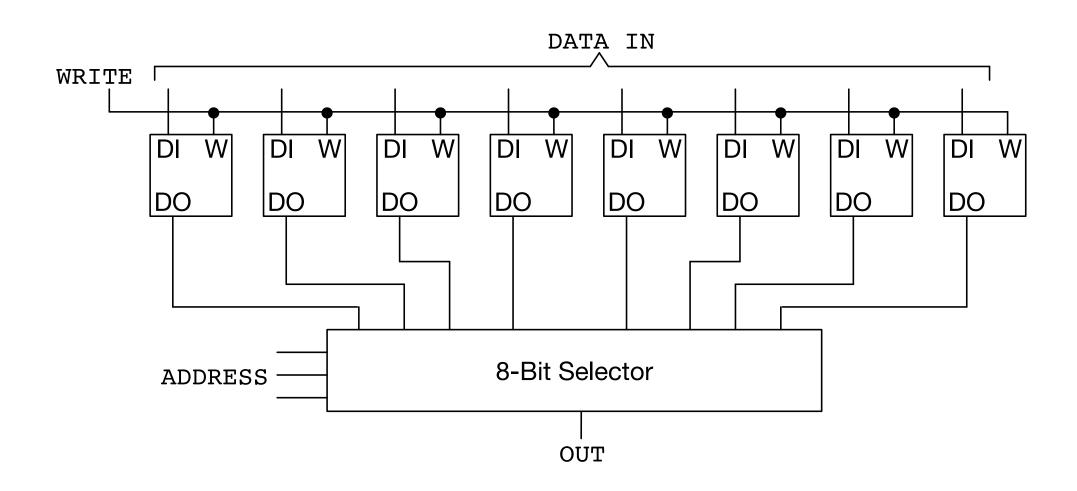

• Now: only read 1 bit at a time

• Select the bit with an address

• Input: address

• Output: bit value

• Truth table

A	ddres	Output	
A2	A 1	A0	OUT
0	0	0	D _O
0	0	1	D_1
0	1	0	D_2
0	1	1	D_3
1	0	0	D_4
1	0	1	D_5
1	1	0	D_6
1	1	1	D_7

• Truth table

A	ddres	Output	
A 2	A 1	A0	OUT
0	0	0	D _O
0	0	1	D_1
0	1	0	D_2
0	1	1	D_3
1	0	0	D_4
1	0	1	D_5
1	1	0	D_6
1	1	1	D_7

• What Boolean operation returns the correct value for address 000?

• Truth table

8 Bit RAM

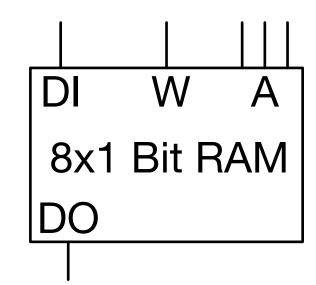

8 Bit RAM

- 8 Bit Random Access Memory (RAM)
- Input
 - address
 - write flag
 - data bit
- Output
 - data bit

- 8x1 bit RAM allows read/write of 1 bit at a time
- What if we want to read/write 2 bits at a time? (and ultimately 8 bits (1 byte) and more)

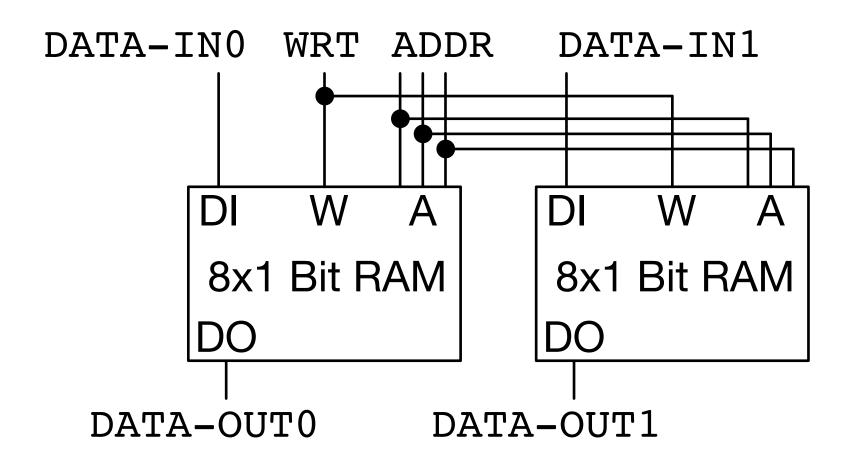

• 8x1 bit RAM allows read/write of 1 bit at a time

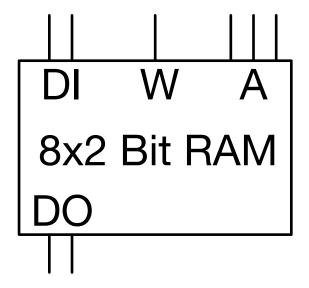

What if we want to read/write 2 bits at a time?
 (and ultimately 8 bits (1 byte) and more)

 \Rightarrow Arrange them together

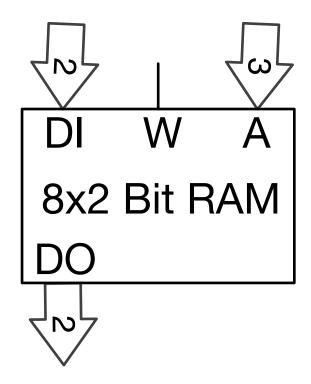

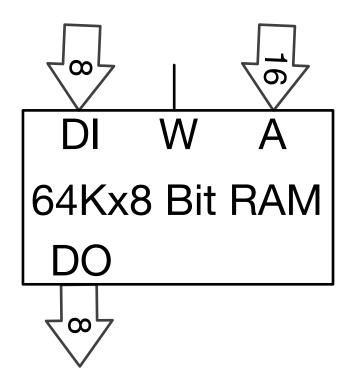

64 KB RAM

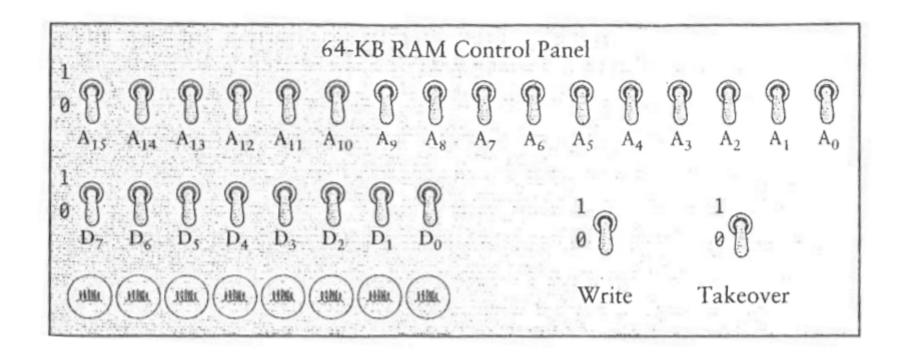

- 64KB = 65,536 bytes
- 16 bit address space $(2^{16} = 65536)$
- Common memory size in the 1980s: we will use it with 6502 assembly
